Other Statuses**NatureServe Conservation Status Factors****Global Short Term Trend:****Global Short Term Trend Comments:** Distribution and abundance are increasing greatly in the Mississippi Basin (Ferber 2001).

Distribution

U.S. States and Canadian Provinces

Endemism: occurs (regularly, as a native taxon) in multiple nations

U.S. & Canada State/Province Distribution

United States | AR⁺, IN⁺, KY⁺, LA⁺, MO⁺

Range Map

No map available.

Global Range Comments: Native to several major Pacific drainages in eastern Asia from the Amur River south through much of the eastern half of China to Pearl River, possibly including northern Vietnam (see Fuller et al. 1999). Has been collected in Alabama, Arizona, Arkansas, Colorado, Florida, Illinois, Indiana, Kansas, Kentucky, Louisiana, Missouri, and Tennessee; Apparently established in Louisiana (Douglas et al. 1996, Douglas and Jordan 2002) and possibly in Illinois (Fuller et al. 1999).

Economic Attributes

Management Summary

Ecology & Life History

Habitat Type: Freshwater

Non-Migrant: N

Locally Migrant: N

Long Distance Migrant: N

Riverine Habitat(s): MEDIUM RIVER

Lacustrine Habitat(s): Shallow water

Special Habitat Factors: Benthic

Population/Occurrence Delineation

Group Name: LARGE CYPRINIDS

Use Class: Not applicable

Minimum Criteria for an Occurrence: Occurrences are based on evidence of historical presence, or current and likely recurring presence, at a given location. Such evidence minimally includes collection or reliable observation and documentation of one or more individuals (including eggs and larvae) in appropriate habitat.

Separation Barriers: Dam lacking a suitable fishway; high waterfall; upland habitat.

Separation Distance for Unsuitable Habitat: 20 km

Separation Distance for Suitable Habitat: 20 km

Separation Justification: Data on dispersal and other movements generally are not available. In some species, individuals may migrate variable distances between spawning areas and nonspawning habitats.

Separation distances (in aquatic kilometers) for cyprinids are arbitrary but reflect the presumption that movements and appropriate separation distances generally should increase with fish size. Hence small, medium, and large cyprinids, respectively, have increasingly large separation distances. Separation distance reflects the likely low probability that two occupied locations separated by less than many kilometers of aquatic habitat would represent truly independent populations over the long term.

Because of the difficulty in defining suitable versus unsuitable habitat, especially with respect to dispersal, and to simplify the delineation of occurrences, a single separation distance is used regardless of habitat quality.

Occupied locations that are separated by a gap of 10 km or more of any aquatic habitat that is not known to be occupied represent different occurrences. However, it is important to evaluate seasonal changes in habitat to ensure that an occupied habitat occurrence for a particular population does not artificially separate spawning areas and nonspawning areas as different occurrences simply because there have been no collections/observations in an intervening area that may exceed the separation distance.
